WARNING:

Failure to read, understand and comply with following instructions, working load limits and specifications in this publication could result in serious injury or damage to property.

GrabiQ Components

GUNNEBO
LIFTING

The All-Inclusive Chain Sling System for Coupling, Shortening and Lifting in Grade 10

2

Our GrabiQ sling system is designed to improve and make your lifting as quick and easy as possible.

GrabiQ means for example;

- 25 % additional strength in the new grade 10 material.
- All top assemblies consist of no more than three components.
- Shortening function of chain legs is integral with no extra components.

One of the main merits of the GrabiQ system is that the work involved in connecting, adjusting and checking the lift takes less time and can be carried out more easily.

The built in shortening function, means that a four-part sling which previously required up to thirteen different top components now needs only three in the GrabiQ system.

Berufsgenossenschaft (BG) in Germany launched a new specification for Grade 10 components in the beginning of 2004, Gunnebo Lifting is one of the first companies in the world to meet the new specifications.

Type Testing

In order to prove the design, material, heat treatment and method of manufacture, each size of component and chain has been type tested in the finished condition in order to demonstrate that the component and chain possesses the required mechanical properties. The following testing procedures are particularly relevant:

Test for Deformation

The Manufacturing Proof Force (MPF) for the relevant size of the component is applied and removed. The dimensions after proof loading shall not alter from the original dimensions within the tolerances prescribed in our specifications and in the international standards.

Static Tensile Test

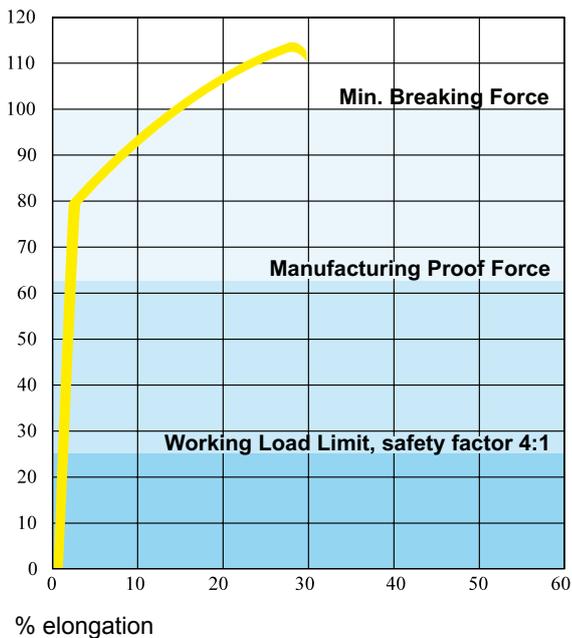

The Breaking Force (BF) for each component and size is verified. The verified value shall be at least equal to the Minimum Breaking Force (MBF) value. The MBF value is equal to the Working Load Limit (WLL) multiplied by the safety factor.

Fatigue Test

By fatigue testing in pulsator testing machines the toughest condition of service is simulated.

Stress / Elongation Diagram

Chain grade 10, type KL
% of min. Breaking Force

Manufacturing Testing

During manufacture continuous process tests are carried out according to the requirements in our specifications and in the latest international standards. The following testing procedures are particularly relevant:

Proof Force

Each individual component and chain link is tested to the Manufacturing Proof Force (MPF) level before delivery. The MPF level is 2.5 times the WLL, equal to 62,5% of the Minimum Breaking Force.

Non Destructive Test / Visual Inspection

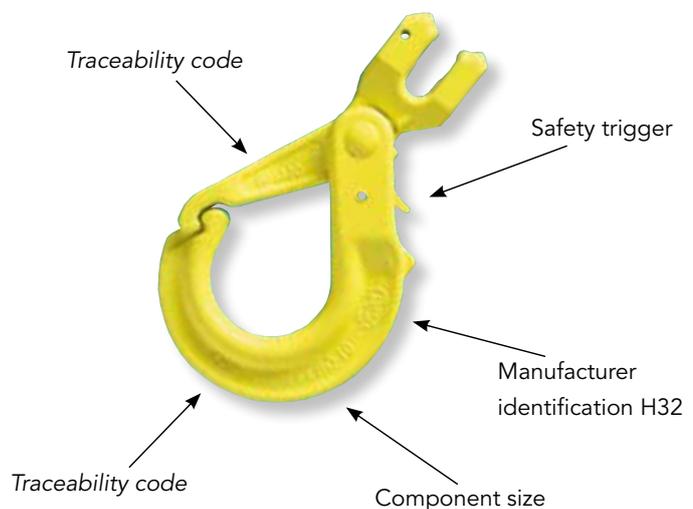

3% of every production batch of forged components are subject to magnetic particle or dye penetrating examination. Visual inspection is carried out on each chain link and each forged component to detect defects.

Static Tensile and Ultimate Elongation test

During manufacture, samples are tested and the Minimum Breaking Force (MBF) value and the total ultimate elongation are verified.

Bending Deflection

During manufacturing, of chain and master links, samples are taken and the minimum bend deflection is verified.

Information For Safe Use and Maintenance

(Also see information about our Classic products, p. 2:26)

The following information aims to give advice and explain the most common questions in order to ensure safe and proper use of lifting equipment.

It is of the utmost importance that this information is known to the user, and in accordance with the Machinery Directive 2006/42/EC this information must be delivered to the customer.

2

Extreme Temperature Conditions

The in-service temperature of the G8+ chain and G10 components affects the WLL as following:

Temp. of chain sling (°C)	Reduction of WLL	
	with Grade 8+ chain	with Grade 10 chain
-40 to +200 C°	0 %	0 %
+200 to +300 C°	10 %	Not allowed
+300 to +400 C°	25 %	Not allowed

Upon return to normal temperature, the sling reverts to its full capacity within the above temperature range. Chain slings should not be used above or below these temperatures.

Surface Treatment

Note! Hot-dip galvanizing or plating is not allowed outside the control of the manufacturer.

Asymmetrical Loading Conditions

For unequally loaded chain legs we recommend that the WLL are determined as follows:

- 2-leg slings calculated as the corresponding 1-leg sling
- 3 and 4-leg slings calculated as the corresponding 1-leg sling. (If it is certain that 2-legs are equally carrying the major part of the load, it can be calculated as the corresponding 2-leg sling.)

Severe Environment

Chain and components must not be used in alkaline (>pH10) or acidic conditions (<pH6).

Comprehensive and regular examination must be carried out when used in severe or corrosive inducing environments.

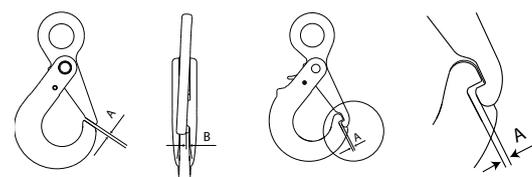

In uncertain situations consult your Gunnebo Lifting dealer.

Maintenance

Periodic thorough examination must be carried out at least every 12 months or more frequently according to statutory regulations, type of use and past experience.

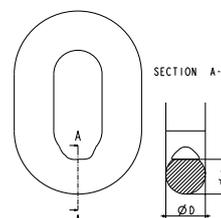

1. Overloaded chain slings must be taken out of service.
2. Chain and components incl. load pins which has been damaged, deformed, elongated, bent or showing signs of cracks or gauges all be replaced. Carefully grind away small sharp cuts and burrs. Additional testing by magnetic particle inspection and/or proof loading at max. 2 x WLL may be carried out.
3. Check the function of latches, triggers and retaining pins / bushes, replace when necessary. Always use Gunnebo Lifting original spare parts.
4. Max. clearance between hook and latch.

Note: For a Griplatch hook measure the difference between dimension A with unloaded spring and dimension A when the latch is pressed against the hook. Clearance B not applicable.

Size	Max. A (mm).	Max. B (mm).
6	2,2	3,5
7/8	2,7	4,5
10	3	6
13	3,3	7
16	4	9
20	5.5	10

5. The wear of the chain and component shall in no place exceed 10% of the original dimensions. The chain link wear - max. 10% - is defined as the reduction of the mean diameter measured in two directions.

$$\frac{D+d}{2} > 0,9d_n$$

Method of Connection

A chain sling is usually attached to the load and the crane by means of terminal fittings such as hooks, links etc. Chain should be without twists or knots. The lifting point should be seated well down in the terminal fitting, never on the point or wedged in the opening. The terminal fitting should be free to incline in any direction.

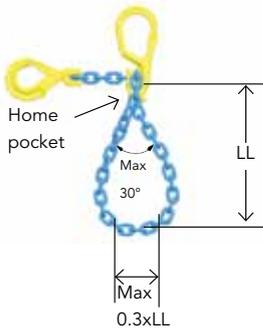

The chain may be passed under or through the load to form a choke hitch or basket hitch. The chain should be allowed to assume its natural angle and should not be hammered down.

Where choke hitch is employed the WLL of the chain sling should be reduced by 20% (unless the LK choker hook is used)

Use edge protection to prevent sharp edges from damaging the lifting equipment. A rule of thumb is that the radius of the edge $> 2 \times$ chain diameter. When lifting with chain directly on lugs we recommend that the lug diameter $> 3 \times$ the pitch of the chain. If a lug diameter is less than stipulated above, the WLL must be reduced by 50%.

Home pocket loop shall have an internal loop top angle of max. 30° . Rule of thumb: Cross dimension of the load shall be max. 0.3 times the loop length (LL)

Definition: The home pocket is the shortening pocket of the top component directly above the clevis to which the chain is connected.

WLL in Tonnes Grade 10 GrabiQ

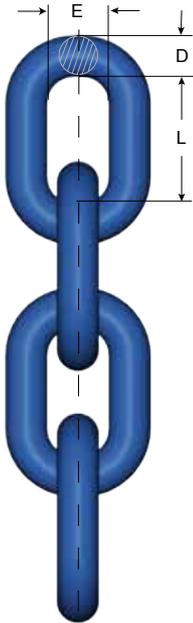

Chain dim.	1-leg	2-leg		3- & 4-leg		Choke hitch	
		β 0-45° α 0-90°	β 45-60° α 90-120°	β 0-45° α 0-90°	β 45-60° α 90-120°	β 0-45° α 0-90°	β 45-60° α 90-120°
6	1.5	2.12	1.5	3.15	2.24	1.6	1.2
8	2.5	3.5	2.5	5.2	3.7	2.7	2

Locking device, see page 20

Product Features - Customer Benefits

- Instant mounting and positioning on any part of the chain.
- Shortening in either chain direction; up-down.
- Designed to prevent inadvertent chain disengagement.
- Can be set idle on the chain leg when shortening is not required.
- LC version offers secure mounting with locking set on any desired part of the chain with one chain direction open for shortening.
- CC version offers close-open function in both chain directions for safe retention of the chain.

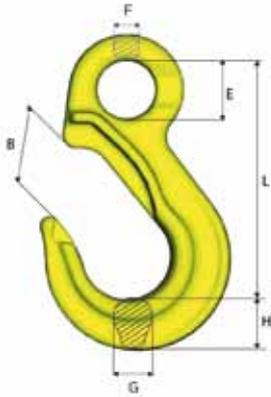

Note! The MIG must be used with at least one of the locking devices. See page 20 for locking devices.

Product Code Guide:

Locking options for the MIG

M48-10	20.00	16.00	40.00	32.00	22.40	16.00	33.60	24.00

*) Provided only axial loading takes place, i.e. no bending force applied in the direction of the thread

Note! Provided only axial loading takes place, i.e. no bending force applied in the direction of the thread.

In case of asymmetric loading we recommend following loading:

- 2-leg as corresponding 1-leg.
- 3- or 4-leg as corresponding 2-leg.

For more lifting points see p. 2:44 - 2:46

Pre-Assembled Chain Sling

”GabiQ-in-a-box” - ready to use at arrival

Gunnebo Lifting offers the perfect retail solution - pre-assembled chain slings, supplied with certificate, packed in boxes. Ready to be used the instant they arrive.

GabiQ chain sling benefits:

- 25% additional strength in the new grade 10 which gives lighter lifting slings.
- All top assemblies consist of no more than three components.
- Shortening function of chain legs is integral with no extra components.

GrabIQ FlexiLeg

GrabIQ FlexiLeg is a flexible chain sling solution with instant leg interchange, where one single master link and a combination of five legs replaces four slings, which is equal to ten legs with the traditional system (a 50 % reduction!). By using the unique features of the GrabIQ range, Gunnebo Lifting has increased the flexibility of lifting with chain slings even further.

Sling configuration:

- 1-leg: M + S
- 2-legs: M + D
- 3-legs: M + D + S
- 4-legs: M + D + D

M1 – Master link (MF)

Alt. M2 – Master link designed for crane hooks, DIN 15401 (MFH).

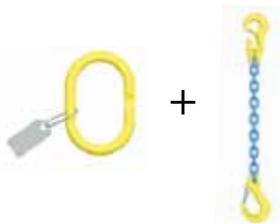

S – single chain sling unit with built in shortening function.

D – double chain sling unit with built in shortening function.

Classic Components

GUNNEBO
LIFTING

Classic

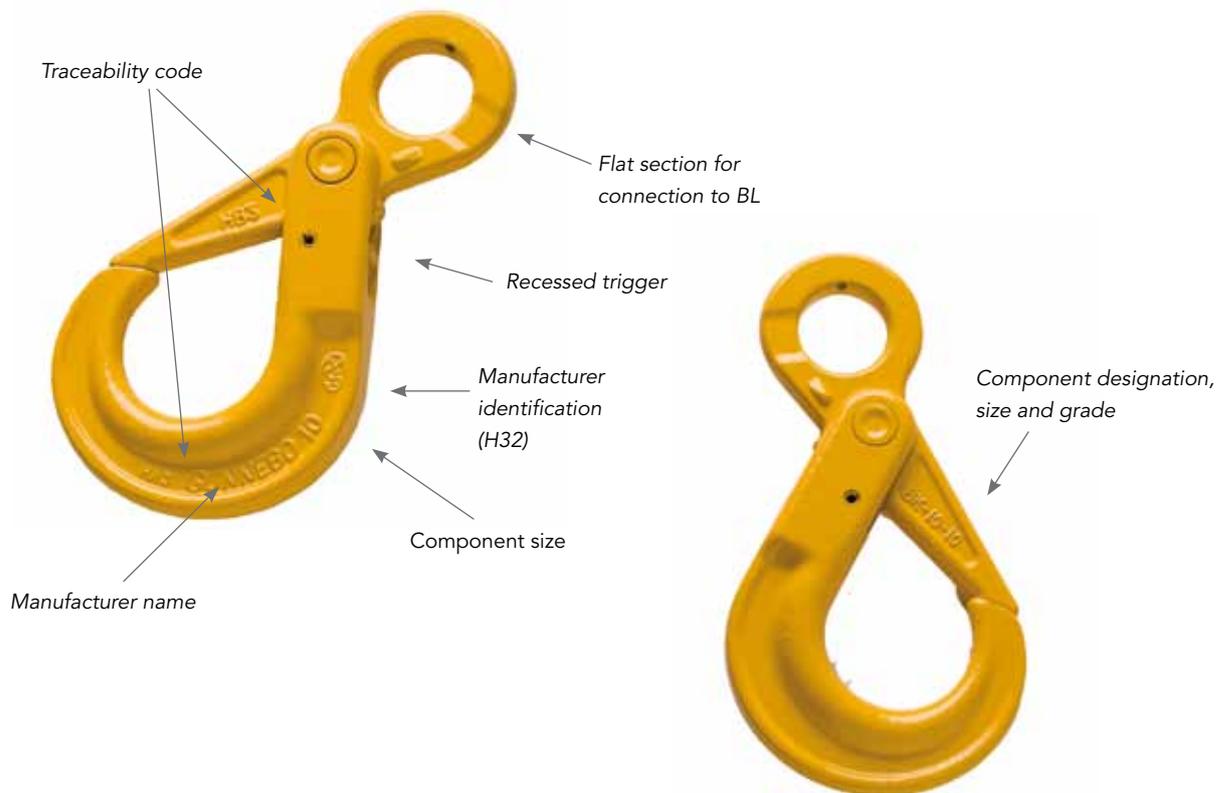

Gunnebo Lifting – Your Partner in Safe Lifting

Chain and components are made from special quenched and tempered alloy steel, a guarantee for very high strength, low weight, high wear resistance and long life.

All Lifting components are uniformly marked with equivalent chain size, grade, manufacturer's designation and name for positive identification.

It's easy to see the difference between a Gunnebo Lifting original component and copies, see the picture below for the characteristics of Gunnebo Lifting Components.

Remember that it's not only the yellow color that symbolises a quality product. Be sure to get the original – be sure that you get a Gunnebo Lifting product!

Information for Safe Use

Extreme temperature conditions

The in service temperature effects the WLL as follows:

Temp. of sling	Reduction of WLL Grade 8
-40° C to 200° C	0%
+200° C to 300° C	10%
+300° C to 400° C	25%

Upon return to normal temperature, the sling reverts to its full capacity within the above temperature range. Chain slings should not be used above or below these temperatures.

Surface Treatment

Note! Hot-dip galvanizing or plating is not allowed outside the control of the manufacturer.

Asymmetric Loading Conditions

For unequally loaded chain legs we recommend that the WLL are determined as follows

- 2-leg slings calculated as the corresponding 1-leg sling
- 3 and 4-leg slings calculated as the corresponding 1-leg sling. (If it is certain that 2-legs are equally carrying the major part of the load, it can be calculated as the corresponding 2-leg sling)

Severe Environment

Chain and components must not be used in alkaline (>pH10) or acidic conditions (<pH6).

Comprehensive and regular examination must be carried out when used in severe or corrosive inducing environments.

In uncertain situations consult your Gunnebo Lifting dealer.

Protect Yourself and Others

- Before each use the chain sling should be checked for obvious damage or deterioration.
- Know the weight of the load, the centre of gravity and ensure it is ready to move and no obstacles will obstruct the lift.
- Check the conformity of the load with the WLL of the ID tag for the specific working configuration. *Never use a sling without a legible valid ID tag!*

- Prepare the landing site.
- Never overload a sling and avoid shock loading.
- Never use an improper sling configuration.
- Never use a worn out or damaged sling.
- Never ride on the load.
- Never walk or stand under a suspended load.
- Take into consideration that the load may swing or rotate.
- Watch your feet and fingers while loading/unloading.

General Advice

- Ensure that the sling is precisely as ordered.
- Ensure that the manufacturers certificate is in order.
- Ensure that the ID-tag corresponds to the information on the certificate (the following ID tag information is compulsory: WLL, Number of chain legs, nominal size (mm) individual ID-mark, manufacturer, CE-marking and year of manufacturing).
- Ensure that all details of the chain sling are recorded.
- Ensure that the staff using the chain sling has received the appropriate information and training.

For information about type testing, see page 2:2

Method of Connection

A chain sling is usually attached to the load and the crane by means of terminal fittings such as hooks, links etc.

Chain should be without twists or knots, if the chain leg needs length adjustment use a shortening device. The lifting point should be seated well down in the terminal fitting, never on the point or wedged in the opening. The terminal fitting should be free to incline in any direction.

The chain may be passed under or through the load to form a choke hitch or basket hitch. The chain should be allowed to assume it's natural angle and should not be hammered down.

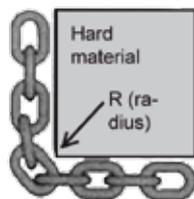

Where choke hitch is employed the WLL of the chain sling should be reduced by 20% (unless the LK choker hook is used)

Endless chain slings shall be rated in the same way as a 2-legged sling.

Sharp edges

Use edge protectors to prevent sharp edges from damaging the chain. If lifting over sharp edges reduce the working load with the following reduction tor.

Edge load	$R > 2 \times \text{chain } \varnothing$	$R > \text{chain } \varnothing$	$R < \text{chain } \varnothing$
Reduction factor	1.0	0.7	0.5

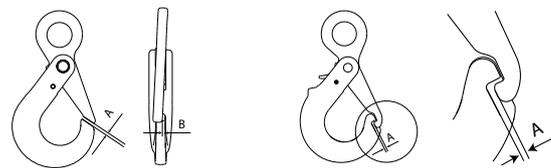

- The angle of the edge must not be below 90o.
- Chain links shall be protected from being bent or deformed and from receiving cuts or gouges.
- Chain sling WLL is to be reduced when chain is rigged over an edge radius R less than two (2) x chain diameter (d).
- Reduced WLL equals chain sling WLL from identification tag x reduction factor.
- Slings shall be padded or protected from edges of their loads when the edge radius is less than 0,5 of the chain diameter(d).
- Slings shall be rigged to prevent chain from sliding over a load edge radius while lifting.
- Slings used in basket hitch shall have the loads balanced to prevent slipping.

When lifting with chain directly on lugs the lug diameter > 3x the pitch of the chain, otherwise the WLL must be reduced by 50%.

Maintenance

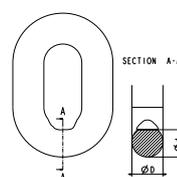

Periodic thorough examination must be carried out at least every 12 months or more frequently according to statutory regulations, type of use and past experience.

1. Overloaded chain slings must be taken out of service.
2. Chain and components incl. load pins which have been damaged, deformed, elongated, bent or showing signs of cracks or gouges shall be replaced. Carefully grind away small sharp cuts and burrs. Additional testing by magnetic particle inspection and/or proof loading at max. 2 x WLL may be carried out.
3. Check the function of latches, triggers and retaining pins / bushes, replace when necessary. Always use Gunnebo Lifting original spare parts.
4. Max. clearance between hook and latch. Note: For a Griplatch hook measure the difference between measure A with unloaded spring and measure A when the latch is pressed against the hook. Clearance B not applicable.

Size	Max. A (mm).	Max. B (mm).
6	2,2	3,5
7/8	2,7	4,5
10	3	6
13	3,3	7
16	4	9
18/20	5,5	10
22	6	11
26	6,5	12
28	7	13

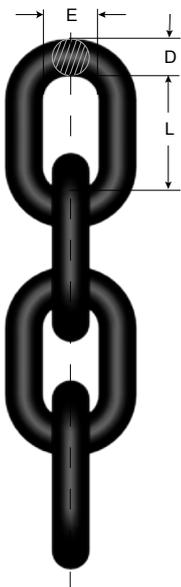

5. The wear of the chain and component shall in no place exceed 10% of the original dimensions. The chain link wear - max. 10% - is defined as the reduction of the mean diameter measured in two directions.

$$\frac{d_1 + d_2}{2} > 0,9d_n$$

d_n = nominal diameter

Chain Classic Grade 8 EN 818-2 Short link chain, KL

Heat treatment

Quenched and tempered.

32	31.5	45.0	31.5	67.0	47.5	50.0

Safety factor 4:1. Working load limits are based upon equally loaded and disposed sling legs.

Note! Different standards applies for Australia, see page 2:48 - 2:49 for further information.

Rules for Correct WLL

Where choke hitch is employed the WLL of the chain sling should be reduced by 20 % (unless the LK choker hook is used).

Asymmetrical Loading Conditions

For unequally loaded chain slings, the following approach to permissible loads is recommended:

- A two-legged system is treated as a single-legged system.
- A three- or four-legged system is treated as a two-legged system.

SLP-3T	3	4.2	3	6.3	4.5
SLP-5T	5	7	5	10.5	7.5

**Note! The above loads apply to normal usage and equally loaded legs. For asymmetric loaded chain slings, the following is recommended:

- A two-legged system is rated as a single-legged system.
- A three- or four-legged system is rated as a two-legged system.

NOTE:

- 1) For engineered lifts, see Clause 7.2(b) in AS 3775.2-2004
- 2) The determination of the angle of the multi-leg sling is the largest included angle at the apex of the configuration.
